Coalescing diffusion particles with masses

System of diffusion particles on the real line that

- start from all points of [0, 1];
- O move independently up to the moment of the meeting;
- coalesce;
- A have mass and diffusion is inversely proportional to mass;
- masses add after sticking.

Arratia flow

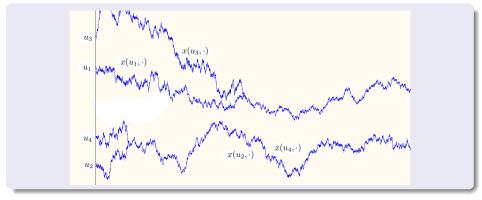

System of diffusion particles on the real line that

- start from all points of [0, 1];
- O move independently up to the moment of the meeting;
- Ocealesce;
- diffusion is equal to 1;

Existence of Arratia flow

Let $P_{u_1,...,u_n}$ is a distribution of a set of coalescing Brownian particles which start from $u_1,...,u_n$.

 P_{u_1,\ldots,u_n} , $u_i \in [0,1]$, is a compatible family.

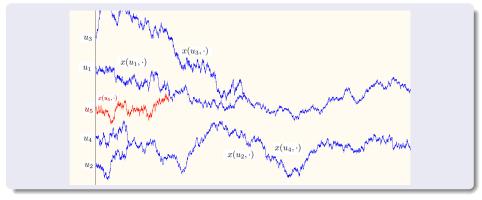

There exists a random process $x(u, \cdot), u \in [0, 1]$, with values in C[0, T].

Existence of Arratia flow

Let $P_{u_1,...,u_n}$ is a distribution of a set of coalescing Brownian particles which start from $u_1,...,u_n$.

 P_{u_1,\ldots,u_n} , $u_i \in [0,1]$, is a compatible family.

There exists a random process $x(u, \cdot), u \in [0, 1]$, with values in C[0, T].

Modification in Skorochod space D([0, 1], C[0, T])

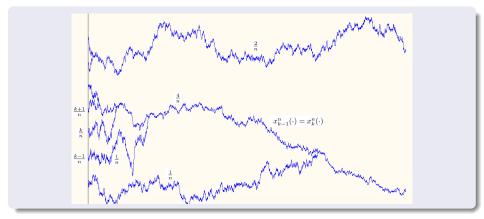

D([0,1],C[0,T]) is a space of right continuous functions from [0,1] to C[0,T] with left limits.

Lemma 1

The process $x(u, \cdot), \ u \in [0, 1]$, has a modification from D([0, 1], C[0, T]).

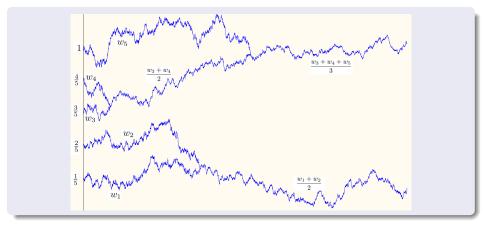

Finite system of particles with masses

Let $x_k^n(t)$, $t \in [0,T]$, k = 1, ..., n, be a system of particles starting from $\frac{k}{n}$, k = 1, ..., n, with masses $\frac{1}{n}$.

Construction of finite system

Let $w_k(t)$, $t \in [0,T]$, k = 1, ..., n, be a set of Wiener processes starting from $\frac{k}{n}$, k = 1, ..., n, with the diffusions $\frac{1}{n}$.

Theorem 2

The processes $x_k^n(t), \ t \geq 0, \ k=1,\ldots,n$ satisfy the following conditions

1°) $x_k^n(\cdot)$ is a continuous square integrable martingale with respect to the filtration

$$\mathcal{F}_t^n = \sigma(x_i^n(s), \ s \le t, \ i = 1, \dots, n);$$

$$\begin{array}{l} 2^{\circ}) \ x_{k}^{n}(0) = \frac{k}{n}, \, k = 1, \dots, n; \\ 3^{\circ}) \ x_{k}^{n}(t) \leq x_{l}^{n}(t), \, k < l, \, t \in [0,T]; \\ 4^{\circ}) \ \langle x_{k}^{n}(\cdot) \rangle_{t} = \int_{0}^{t} \frac{1}{m_{k}^{n}(s)} ds \\ & \text{ where } m_{k}^{n}(t) = \frac{1}{n} \#\{i: \ \exists s \leq t \ x_{i}^{n}(s) = x_{k}^{n}(s)\}; \\ 5^{\circ}) \ \langle x_{k}^{n}(\cdot), x_{l}^{n}(\cdot) \rangle_{t} = 0, \quad t < \tau_{k,l}^{n}, \\ & \text{ where } \tau_{k,l} = \inf\{t: \ x_{k}^{n}(t) = x_{l}^{n}(t)\}. \end{array}$$

$$\begin{array}{l} \text{Conditions } 1^{\circ}) - 5^{\circ} \end{pmatrix} \text{ uniquely determine the distribution on } (C[0,T])^{n}. \end{array}$$

There exists constant C , which doesn't depend on n, such that for all k and $t\in(0,T]$

$$\mathbb{E}\frac{1}{m_k^n(t)} \le \frac{C}{\sqrt{t}}.$$

The proof of lemma follows from inequalities

$$\begin{split} \mathbb{P}\left\{\frac{1}{m_k^n(t)} > r\right\} &= \mathbb{P}\left\{m_k^n(t) < \frac{1}{r}, x_l^n(t) - x_k^n(t) > 0\right\} \le \\ &\leq \mathbb{P}\left\{\min_{[0,t]}\left(\frac{1}{r} + \sqrt{r}w(s)\right) > 0\right\} = \mathbb{P}\left\{\max_{[0,1]}w(s) < \frac{1}{tr\sqrt{r}}\right\} \le \frac{C_1}{\sqrt{t}r^{\frac{3}{2}}} \end{split}$$

and equality

$$\mathbb{E}\frac{1}{m_k^n(t)} = \int_0^\infty \mathbb{P}\left\{\frac{1}{m_k^n(t)} > r\right\} dr.$$

Corollary 4

There exists constant C, which doesn't depend on n, such that for all k and $t\in[0,T]$

$$\mathbb{E}\langle x_k^n(\cdot)\rangle_t = \mathbb{E}\int_0^t \frac{1}{m_k^n(s)} ds \le C\sqrt{t}.$$

This corollary implies that

$$\mathbb{E}\left(x_k^n(t) - \frac{k}{n}\right)^2 \le C\sqrt{t}.$$

Finite system as random element in D([0, 1], C[0, T])

Denote

$$y_n(u, \cdot) = \begin{cases} x_k^n(\cdot), & \frac{k-1}{n} \le u < \frac{k}{n}, & k = 1, \dots, n, \\ x_n^n(\cdot), & u = 1. \end{cases}$$

We will interpret $\{y_n(u, \cdot), u \in [0, 1]\}$ as a random process with values in C[0, T]. y_n is a random element in D([0, 1], C[0, T]).

Lemma 5

For all $\varepsilon > 0$ and u the sequence $\{y_n(u,t), t \in [\varepsilon,T]\}_{n \ge 1}$ is tight in $C[\varepsilon,T]$.

Lemma 6

For all $n \in \mathbb{N}$, $u \in [0, 2]$, $h \in [0, u]$ and $\lambda > 0$

$$\mathbb{P}\{\|y_n(u+h,\cdot)-y_n(u,\cdot)\|>\lambda, \ \|y_n(u,\cdot)-y_n(u-h,\cdot)\|>\lambda\}\leq \frac{Ch^2}{\lambda^2}.$$

Here $y_n(u, \cdot) = y_n(1, \cdot)$, $u \in [1, 2]$.

For all $\varepsilon > 0$ $\{y_n(u,t), u \in [0,1], t \in [\varepsilon,T]\}$ is tight in $D([0,1], C[\varepsilon,T])$

See Theorem 3.8.6, Theorem 3.8.8 and Corollary 3.8.9. *Ethier S. N. and Kurtz T. G.* Markov processes: Characterization and convergence (1996), Wiley, New York.

Corollary 8

 $\{y_n(u,t), u \in [0,1], t \in (0,T]\}$ is tight in D([0,1], C(0,T]).

There exists a subsequence $\{n'\}$ such that

 $\{y_{n'}(u,t), u \in [0,1], t \in (0,T]\} \rightarrow \{y(u,t), u \in [0,1], t \in (0,T]\}$ in distribution.

So, $\{y(u,t), u \in [0,1], t \in (0,T]\}$ is a random element in D([0,1],C(0,T])

For all $\varepsilon > 0$ $\{y_n(u,t), u \in [0,1], t \in [\varepsilon,T]\}$ is tight in $D([0,1], C[\varepsilon,T])$

See Theorem 3.8.6, Theorem 3.8.8 and Corollary 3.8.9. *Ethier S. N. and Kurtz T. G.* Markov processes: Characterization and convergence (1996), Wiley, New York.

Corollary 8

 $\{y_n(u,t),\ u\in[0,1],\ t\in(0,T]\} \text{ is tight in } D([0,1],C(0,T]).$

There exists a subsequence $\{n'\}$ such that

 $\{y_{n'}(u,t), u \in [0,1], t \in (0,T]\} \rightarrow \{y(u,t), u \in [0,1], t \in (0,T]\}$ in distribution.

So, $\{y(u,t), u \in [0,1], t \in (0,T]\}$ is a random element in D([0,1],C(0,T])

For all $\varepsilon > 0$ $\{y_n(u,t), u \in [0,1], t \in [\varepsilon,T]\}$ is tight in $D([0,1], C[\varepsilon,T])$

See Theorem 3.8.6, Theorem 3.8.8 and Corollary 3.8.9. *Ethier S. N. and Kurtz T. G.* Markov processes: Characterization and convergence (1996), Wiley, New York.

Corollary 8

 $\{y_n(u,t), u \in [0,1], t \in (0,T]\}$ is tight in D([0,1], C(0,T]).

There exists a subsequence $\{n'\}$ such that

 $\{y_{n'}(u,t), \ u \in [0,1], \ t \in (0,T]\} \to \{y(u,t), \ u \in [0,1], \ t \in (0,T]\} \quad \text{in distribution}.$

So, $\{y(u,t), u \in [0,1], t \in (0,T]\}$ is a random element in D([0,1], C(0,T]).

Next, we will be interested what properties the process y satisfy, especially

$$y(\cdot,t) \to ?, \quad t \to 0.$$

If particles coalesce very soon then we may have the following.

Lemma 9

n

Let φ be a twice continuously differentiable function that are bounded together with its derivatives and let

$$\xi_n(t) = \int_0^1 \varphi(y_n(u,t)) du, \quad t \in [0,T].$$

Then the sequences $\{\xi_n(t), t \in [0,T]\}$ is tight in C[0,T].

Proof. Let us use Aldous' tightness criterion. Take $\varepsilon > 0$, a set of stoping times $\{\sigma_n\}_{n>1}$ on [0,T] and sequence $\delta_n \searrow 0$.

$$\xi_n(\sigma_n + t) - \xi_n(\sigma_n) = \frac{1}{n} \sum_{k=1}^n [\varphi(x_k^n(\sigma_n + t)) - \varphi(x_k^n(\sigma_n))] = \sum_{k=1}^n \int_0^t \dot{\varphi}(x_k^n(\sigma_n + s)) dx_k^n(\sigma_n + s) + \frac{1}{2n} \sum_{k=1}^n \int_0^t \frac{\ddot{\varphi}(x_k^n(\sigma_n + s))}{m_k^n(\sigma_n + s)} ds = M(t) + \frac{1}{2}A(t)$$

Estimate $\mathbb{E}|A(t)|$ and $\mathbb{E}|M(t)|$

Prolongation on space D([0,1], C[0,T]). Proof of Lemma 9

Define the number of different points $x_k^n(\sigma_n+t)$, $k=1,\ldots,n$ by $\chi_n(t).$ So,

$$\mathbb{E}|A(t)| \le \|\ddot{\varphi}\|\mathbb{E}\int_0^t \chi_n(s)ds \le \|\ddot{\varphi}\|\sum_{k=1}^n \mathbb{E}\gamma_k^n(t),$$

where $\gamma_1^n(t) = t$,

$$\gamma_k^n(t) = \inf\{s: x_k^n(\sigma_n + s) = x_{k-1}^n(\sigma_n + s)\} \land t, \ k = 2, \dots, n,$$

are times of free runs of particles x^n on $[\sigma_n, \sigma_n + t]$. Consider

$$\mathbb{E}\gamma_k^n(t) = \mathbb{E}(\mathbb{E}(\gamma_k^n(t)|\mathcal{F}_{\sigma_n}^{x^n})) = \mathbb{E}(\mathbb{E}_{x^n(\sigma_n)}\widetilde{\gamma}_k^n(t)) \le \mathbb{E}(\mathbb{E}_{x^n(\sigma_n)}\widehat{\gamma}_k^n(t))$$

Here $\tilde{\gamma}^n(t)$ and $\hat{\gamma}^n(t)$ are times of free runs on [0, t] of particles with mass and of coalescing Brownian particles respectively. So,

$$\mathbb{E}|A(t)| \le \|\ddot{\varphi}\| \sum_{k=1}^{n} \mathbb{E}(\mathbb{E}_{x^{n}(\sigma_{n})}\widehat{\gamma}_{k}^{n}(t)) \le C\mathbb{E}(x_{n}^{n}(\sigma_{n}) - x_{1}^{n}(\sigma_{n}))\sqrt{t} \le C\sqrt{t}.$$

Prolongation on space D([0,1], C[0,T]). Proof of Lemma 9

Similarly

$$\begin{split} (\mathbb{E}|M(t)|)^2 &\leq \mathbb{E}M^2(t) \leq \mathbb{E}\left(\frac{1}{n}\sum_{k=1}^n\int_0^t \dot{\varphi}(x_k^n(\sigma_n+s))dx_k^n(\sigma_n+s)\right)^2 \leq \\ &\leq \frac{1}{n}\sum_{k=1}^n \mathbb{E}\int_0^t \dot{\varphi}^2(x_k^n(\sigma_n+s))ds \leq \|\dot{\varphi}^2\|t. \end{split}$$

Using the previous estimations and Chebyshev's inequality we obtain

$$\lim_{n \to \infty} \mathbb{P}\{|\xi_n(\sigma_n + \delta_n) - \xi_n(\sigma_n)| \ge \varepsilon\} = 0.$$

<□> <□> <□> <三> <三> <三> <三> の<

Proposition 10

Let φ be a twice continuously differentiable function that are bounded together with its derivatives. Then

$$\int\limits_{0}^{1} \varphi(y(u,t)) du \to \int\limits_{0}^{1} \varphi(u) du \ \, \text{in probability, } \ \, \text{as} \ t \to 0.$$

Proof. Take a subsequence $\{n'\}$ such that

$$\int_{0}^{1} \varphi(y_{n'}(u,\cdot)) du \xrightarrow{d} \xi(\cdot) \text{ in } C[0,T].$$

Since the map $F_{\varphi}: \mathrm{D}([0,1],\mathbb{R}) \to \mathbb{R}$ $F_{\varphi}(g) = \int_{0}^{1} \varphi(g(u)) du$ is continuous,

$$\int_{0}^{1} \varphi(y(u,t)) du \stackrel{d}{=} \xi(t) \stackrel{a.s.}{\to} \xi(0) = \int_{0}^{1} \varphi(u) du.$$

$$y_n(u,\cdot) \to y(u,\cdot)$$
 in $C(0,T]$?

Lemma 11

For all $u \in [0,1]$

 $\mathbb{P}\{y(u,\cdot) \neq y(u-,\cdot)\} = 0.$

Corollary 12

From Lemma 11 we can conclude that for all $u \in [0,1]$

 $y_n(u,\cdot) \to y(u,\cdot)$ in C(0,T] in distribution

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

$$y_n(u,\cdot) \to y(u,\cdot)$$
 in $C(0,T]$?

Lemma 11

For all $u \in [0, 1]$

$$\mathbb{P}\{y(u,\cdot)\neq y(u-,\cdot)\}=0.$$

Corollary 12

From Lemma 11 we can conclude that for all $u \in [0,1]$

 $y_n(u,\cdot) \to y(u,\cdot)$ in C(0,T] in distribution

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Proposition 13

Set

$$y(u,0) = u, \ u \in [0,1].$$

Then $\{y(u,t), u \in [0,1], t \in [0,T]\}$ belongs D([0,1], C[0,T]) a.s. Furthermore, for all $u \in [0,1]$ $y(u, \cdot)$ is a square integrable (\mathcal{F}_t) -martingale, where

 $\mathcal{F}_t = \sigma(y(u, s), \ u \in [0, 1], \ s \le t).$

Next, we want $\{y(u,t), u \in [0,1], t \in [0,T]\}$ to describe the evolution of particles starting from all points of [0,1].

Properties

Particles

- are diffusion;
- Start from all points;
- coalesce;
- O change mass and diffusion;
- o move independently up to the moment of the meeting.

Theorem 14

 $\{y(u,t), u \in [0,1], t \in [0,T]\}$ satisfies

 ${f 0}\,\,\,y(u,\cdot)$ is a continuous square integrable martingale with respect to

 $\mathcal{F}_t = \sigma(y(u,s), \ u \in [0,1], \ s \le t);$

- (u,0) = u;
- $\begin{array}{l} \textcircled{0} \hspace{0.1cm} \langle y(u,\cdot)\rangle_t = \int\limits_0^t \frac{ds}{m(u,s)}, \\ \\ \hspace{0.1cm} \text{where} \hspace{0.1cm} m(u,t) = \lambda\{v: \hspace{0.1cm} \exists s \leq t \hspace{0.1cm} y(v,s) = y(u,s)\} \end{array}$

$$\begin{array}{l} (y(u,\cdot),y(v,\cdot))_{t\wedge\tau_{u,v}}=0,\\ \text{where }\tau_{u,v}=\inf\{t:\;y(u,t)=y(v,t)\}\wedge\mathcal{I} \end{array} \end{array}$$

Properties

Particles

- are diffusion;
- start from all points;
- coalesce;
- change mass and diffusion;
- o move independently up to the moment of the meeting.

Theorem 14

 $\{y(u,t), u \in [0,1], t \in [0,T]\}$ satisfies

 ${\small \bigcirc} \ y(u,\cdot) \text{ is a continuous square integrable martingale with respect to}$

$$\mathcal{F}_t = \sigma(y(u,s), \ u \in [0,1], \ s \le t);$$

2
$$y(u,0) = u;$$

$$\ \, {\bf 9} \ \, y(u,t) \leq y(v,t) \ \, {\rm if} \ \, u < v;$$

$$\begin{array}{l} \bullet \quad \langle y(u,\cdot)\rangle_t = \int\limits_0^t \frac{ds}{m(u,s)}, \\ \text{where } m(u,t) = \lambda\{v: \ \exists s \leq t \ y(v,s) = y(u,s)\} \end{array}$$

$$\begin{array}{l} \textcircled{0} \quad \langle y(u,\cdot), y(v,\cdot) \rangle_{t \wedge \tau_{u,v}} = 0, \\ \text{where } \tau_{u,v} = \inf\{t : \ y(u,t) = y(v,t)\} \wedge T \end{array}$$

Theorem 15

For every bounded continuous function φ there exists the limit

$$\int\limits_0^1\int\limits_0^{\cdot}\varphi(y(u,s))dy(u,s)du:=\lim_{\lambda\to 0}\sum_{k=1}^n\int\limits_0^{\cdot}\varphi(y(\widetilde{u}_k,s))dy(\widetilde{u}_k,s)\Delta u_k$$

in a space of continuous square integrable martingale and the quadratic characteristic of the limit point is

$$\int\limits_{0}^{\cdot}\int\limits_{0}^{1} \varphi^2(y(u,s)) du ds.$$

Moreover, for each twice continuously differentiable function φ that are bounded together with its derivatives we have

$$\int_{0}^{1} \varphi(y(u,t)) du = \int_{0}^{1} \varphi(y(u,0)) du + \int_{0}^{1} \int_{0}^{t} \dot{\varphi}(y(u,s)) dy(u,s) du + \frac{1}{2} \int_{0}^{t} \int_{0}^{1} \frac{\ddot{\varphi}(y(u,s))}{m(u,s)} du ds.$$

- Uniqueness of distribution;
- **2** Asymptotic growth of the particle mass for small t;
- Asymptotic behaviour of the particle for small t;

Thank you!
